Probability Recap

- Conditional probability

$$P(x|y) = \frac{P(x,y)}{P(y)}$$

- Product rule

$$P(x,y) = P(x|y)P(y)$$

- Chain rule

- X, Y independent if and only if: $\forall x, y : P(x,y) = P(x)P(y)$

- X and Y are conditionally independent given Z if and only if:

$$\forall x, y, z : P(x,y|z) = P(x|z)P(y|z) \qquad X \perp\!\!\!\perp Y | Z$$

Bayes' Nets

- A Bayes' net is an efficient encoding of a probabilistic model of a domain

- Questions we can ask:

  - Inference: given a fixed BN, what is P(X | e)?

  - Representation: given a BN graph, what kinds of distributions can it encode?

 - Modeling: what BN is most appropriate for a given domain?

Bayes' Net Semantics

- A directed, acyclic graph, one node per random variable

- A conditional probability table (CPT) for each node

  - A collection of distributions o   tion of parents' values

- Bayes' nets implicitly encode joint distri

  - As a product of local conditional distributions
  - To see what probability a BN gives to a full assignment, multiply all the relevant conditionals together:

$$P(x_1, x_2, \ldots x_n) = \prod_{i=1}^{n} P(x_i | parents(X_i))$$

Y	P(Y)
+y	0.7
¬y	0.3

Example: Alarm Network

B	P(B)
+b	0.001
-b	0.999

E	P(E)
+e	0.002
-e	0.998

B   E

A

J   M

A	J	P(J|A)
+a	+j	0.9
+a	-j	0.1
-a	+j	0.05
-a	-j	0.95

A	M	P(M|A)
		.7
		.3
-a	+m	0.01
-a	-m	0.99

B	E	A	P(A|B,E)
+b	+e	+a	0.95
+b	+e	-a	0.05
+b	-e	+a	0.94
+b	-e	-a	0.06
-b	+e	+a	0.29
-b	+e	-a	0.71
-b	-e	+a	0.001
-b	-e	-a	0.999

$$P(+b, -e, +a, -j, +m) =$$

Example: Alarm Network

B	P(B)
+b	0.001
-b	0.999

E	P(E)
+e	0.002
-e	0.998

A	J	P(J|A)
+a	+j	0.9
+a	-j	0.1
-a	+j	0.05
-a	-j	0.95
A	M	P(M|A)
		.7
		.3
-a	+m	0.01
-a	-m	0.99

B	E	A	P(A|B,E)
+b	+e	+a	0.95
+b	+e	-a	0.05
+b	-e	+a	0.94
+b	-e	-a	0.06
-b	+e	+a	0.29
-b	+e	-a	0.71
-b	-e	+a	0.001
-b	-e	-a	0.999

$$P(+b, -e, +a, -j, +m) =$$
$$P(+b)P(-e)P(+a|+b, -e)P(-j|+a)P(+m|+a) =$$
$$0.001 \times 0.998 \times 0.94 \times 0.1 \times 0.7$$

Size of a Bayes' Net

- How big is a joint distribution over N Boolean variables?

2^N

- How big is an N-node net if have up to k parents?

$O(N * 2^{k+1})$

- Both give you the power to calculate

$$P(X_1, X_2, \ldots X_n)$$

BNs: Huge space savings!

Bayes' Nets

✓ Representation

Conditional Independences

Prob

Learning Bayes' Nets from Data

Conditional Independence

- X and Y are independent if

$$\forall x, y \ \ P(x,y) = P(x)P(y) \ \dashrightarrow \ X \perp\!\!\!\perp Y$$
- X and Y are conditio given Z

$$\dashrightarrow X \perp\!\!\!\perp Y|Z$$

- (Conditional) independence is a property of a distribution

- Example: $Alarm \perp\!\!\!\perp Fire | Smoke$

Bayes Nets: Assumptions

- Assumptions we are required to make to define the Bayes net when given the graph:

$$P(x_i | x_1 \cdots x_{i-1}) = P(x_i | parents(X_i))$$

- Beyond above "chain rule →
  independence assumptions

  - Often additional conditional independences

  - They can be read off the graph

- Important for modeling: understand assumptions made when choosing a Bayes net graph

Example

- Conditional independence assumptions directly from simplifications in chain rule:

- Additional implied conditional independence assumptions?

Independence in a BN

- Important question about a BN:
  - Are two nodes independent given certain evidence?
  - If yes, can prove using algebra (tedious in general)
  - If no, can pro   ple
  - Example:

X → Y → ◯

- Question: are X and Z necessarily independent?
  - Answer: no. Example: low pressure causes rain, which causes traffic.
  - X can influence Z, Z can influence X (via Y)
  - Addendum: they *could* be independent: how?

D-separation: Outline

Assignment Project Exam Help

https://eduassistpro.github.io/

Add WeChat edu_assist_pro

D-separation: Outline

- Study independence properties for triples

- Analyze comple   f member triples

- D-separation: a condition /   m for answering such queries

Causal Chains

- This configuration is a "causal chain"

- Guaranteed X independent of Z ?   *No!*

  - One example set of CPTs for which X is not independent of Z is sufficient to show this independence is not guaranteed.

ple:

pressure causes rain causes fic,

high pressure causes no rain causes no traffic

X: Low pressure   Y: Rain   Z: Traffic

$$P(x, y, z) = P(x)P(y|x)P(z|y)$$

- In numbers:

P(+y | +x) = 1, P(-y | - x) = 1,
P(+z | +y) = 1, P(-z | -y) = 1

Causal Chains

- This configuration is a "causal chain"

- Guaranteed X independent of Z given Y?

$$P(z|x,y) = \frac{P(x,y,z)}{P(x,y)}$$

$$= \frac{P(x)P(y|x)P(z|y)}{P(x)P(y|x)}$$

$$= P(z|y)$$

Yes!

X: Low pressure   Y: Rain   Z: Traffic

$$P(x,y,z) = P(x)P(y|x)P(z|y)$$

- Evidence along the chain "blocks" the influence

Common Cause

- This configuration is a "common cause"

- Guaranteed X independent of Z ? *No!*

  - One example set of CPTs for which X is not independent of Z is sufficient to show this independence is not guaranteed.

Y: Project due

ple.

ject due causes both forums busy and lab full

- In numbers:

X: Forums busy

Z: Lab full

P(+x | +y) = 1, P(-x | -y) = 1,
P(+z | +y) = 1, P(-z | -y) = 1

$$P(x, y, z) = P(y)P(x|y)P(z|y)$$

Common Cause

- This configuration is a "common cause"

Y:
Project
due

X:
Forums
busy

Z: Lab full

$$P(x, y, z) = P(y)P(x|y)P(z|y)$$

- Guaranteed X and Z independent given Y?

$$P(z|x, y) = \frac{P(x, y, z)}{P(x, y)}$$
$$= \frac{P(y)P(x|y)P(z|y)}{P(y)P(x|y)}$$

$$= P(z|y)$$

Yes!

- Observing the cause blocks influence between effects.

Common Effect

- Last configuration: two causes of one effect (v-structures)

X: Raining Y: Ballgame

Z: Traffic

- Are X and Y independent?

  - *Yes*: the ballgame and the rain cause traffic, but they are not correlated

    to prove they must be (try it!)

  - A   independent given Z?

  - *No*: seeing traffic puts the rain and the ballgame in competition as explanation.

- This is backwards from the other cases

  - Observing an effect activates influence between possible causes.

The General Case

Assignment Project Exam Help

https://eduassistpro.github.io/

Add WeChat edu_assist_pro

The General Case

- General question: in a given BN, are two variables independent (given evidence)?

- Solution: analyze t

- Any complex example can be broken

  into repetitions of the three canonical cases
Active / Inactive Paths

- Question: Are X and Y conditionally independent given evidence variables {Z}?
  - Yes, if X and Y "d-separated" by Z
  - Consider all (undirected) paths from X to Y
  - No active paths = independence

- A path is active if each triple is active:
  - Causal chain $A \rightarrow B \rightarrow C$ where B is unobserved (either direction)
  - Common cause $A \leftarrow B \rightarrow C$ where B is unobserved
  - Common effect (aka v-structure)
    $A \rightarrow B \leftarrow C$ where B *or one of its descendents* is observed

- All it takes to block a path is a single inactive segment

Active Triples

Inactive Triples

Assignment Project Exam Help

https://eduassistpro.github.io/

Add WeChat edu_assist_pro

D-Separation

- Query: $X_i \perp\!\!\!\perp X_j | \{X_{k_1}, ..., X_{k_n}\}$?

- Check all (undirected) paths between X_i and X_j
  - If one or more active, then independence is not guaranteed

$$X_i \not\perp\!\!\!\perp X_j | \{X_{k_1}, ..., X_{k_n}\}$$

  - Otherwise (i.e. if all paths are inactive),
    then independence is guaranteed

$$X_i \perp\!\!\!\perp X_j | \{X_{k_1}, ..., X_{k_n}\}$$

Example

$R \perp\!\!\!\perp B$

$R \perp\!\!\!\perp B | T$

$R \perp\!\!\!\perp B | T'$

Example

$L \perp\!\!\!\perp T' | T$ Assignment Project Exam Help Yes

$L \perp\!\!\!\perp B$ https://eduassistpro.github.io/

$L \perp\!\!\!\perp B | T$ Add WeChat edu_assist_pro

$L \perp\!\!\!\perp B | T'$

$L \perp\!\!\!\perp B | T, R$ *Yes*

Example
- Variables:
  - R: Raining
  - T: Traffic
  - D: Roof d
  - S: I'm sa

- Questions:

$$T \perp\!\!\!\perp D$$

$$T \perp\!\!\!\perp D | R \qquad \textit{Yes}$$

$$T \perp\!\!\!\perp D | R, S$$

Structure Implications

- Given a Bayes net structure, can run d-separation algorithm to build a complete list of conditional independences that are necessarily true of the form

$$X_i \perp\!\!\!\perp X_j | \{X_{k_1}, \dots, X_{k_n}\}$$

- This list determines the set of probability distributions that can be represented

Computing All Independences
Topology Limits Distributions

- Given some graph topology G, only certain joint distributions can be encoded

- The graph structure guarantees certain (conditional) independences

- (There might be more independence)

- Adding arcs increases the set of distributions, but has several costs

- Full conditioning can encode any distribution

$$\{X \perp\!\!\!\perp Y, X \perp\!\!\!\perp Z, Y \perp\!\!\!\perp Z,$$
$$X \perp\!\!\!\perp Z \mid Y, X \perp\!\!\!\perp Y \mid Z, Y \perp\!\!\!\perp Z \mid X\}$$

$$\{X \perp\!\!\!\perp Z \mid Y\}$$

$$\{\}$$

Bayes Nets Representation Summary

- Bayes nets compactly encode joint distributions

- Guaranteed independencies of distributions can be deduced from

- D-separation gives precise independence guarantees from graph alon

- A Bayes' net's joint distribution may have further (conditional) independence that is not detectable until you inspect its specific distribution
